         plt.show()
```

Comentário: Nas lojas onde a temperatura cai muito abaixo do ponto de congelamento (32°F), o impacto nas vendas é mais evidente. Isso se reflete especialmente no primeiro quartil do boxplot (rabicho inferior), indicando que temperaturas extremamente baixas estão associadas a quedas significativas nas vendas.

Temperaturas extremas resultam em menor circulação nas lojas, refletindo na redução de vendas semanais. A tendência linear negativa mostra que, à medida que a temperatura se afasta da faixa ideal, seja para frio ou calor excessivo, as vendas tendem a cair. Isso pode ser um indicativo para ações de marketing ou promoções específicas para esses períodos, a fim de estimular as vendas e minimizar o impacto negativo das temperaturas extremas no desempenho comercial.

In []: A análise das 10 lojas que apresentam maior correlação negativa entre temperatura e vendas semar Essas áreas são impactadas por condições climáticas extremas, que reduzem a circulação de client Esse padrão demonstra como a sazonalidade e fatores regionais influenciam o desempenho comercial para atender às necessidades específicas dos consumidores em locais com temperaturas severas.

```

Evidência da Redução de Vendas Devido à Temperaturas Extremas - Loja 10

Observa-se que as temperaturas extremas impactam significativamente as vendas semanais. À medida que a temperatura aumenta de 50°F para 90°F, há uma clara tendência de queda nas vendas, que variam de 2,2 milhões para cerca de 1,8 milhões de unidades monetárias, indicando que o calor excessivo pode

desencorajar os clientes a visitar a loja. Analisando temperaturas abaixo de 50°F, as vendas também mostram variação: em semanas com temperaturas entre 42.58°F e 49.98°F, as vendas oscilam de 1,71 milhões a 3,49 milhões, sendo este último valor influenciado pelo pico de Natal em 23-12-2011. Excluindo esse outlier, a média de vendas em temperaturas abaixo de 50°F é de aproximadamente 1,96 milhões, sugerindo que o frio extremo também reduz as vendas, mas com menor impacto que o calor. A linha de tendência linear do gráfico reforça a correlação negativa entre temperatura e vendas, destacando que condições climáticas extremas, tanto quentes quanto frias, afetam negativamente o desempenho da Loja 10, embora fatores sazonais, como feriados, possam mitigar esses efeitos em períodos específicos.

Análise do Gráfico Picos de Vendas: O maior pico de vendas ocorre em 24-12-2010 (3.75M), coincidindo com o Natal, e outro pico significativo em 23-12-2011 (3.49M), também no Natal. Esses picos não parecem estar diretamente relacionados à temperatura, que é moderada nessas datas (48.43°F e 48.02°F, respectivamente). Temperatura Máxima: A temperatura mais alta (91.65°F) ocorre em 05-08-2011, com vendas de 1.77M, que estão abaixo da média, sugerindo que temperaturas muito altas podem reduzir as vendas. Tendências Gerais: As vendas tendem a ser mais altas no final do ano (novembro e dezembro), independentemente da temperatura, enquanto temperaturas extremas (muito altas ou muito baixas) parecem estar associadas a vendas mais baixas em outros períodos.

Correlação entre Vendas e Temperatura na Loja 10: Uma Análise Detalhada

A análise dos dados da Loja 10 revela uma relação complexa e significativa entre a temperatura e o volume de vendas semanais. Observa-se um padrão onde a queda nas temperaturas parece preceder um pico de vendas, sugerindo uma possível antecipação dos consumidores para se abastecerem antes da chegada de

um frio mais intenso (abaixo de 40°F). Essa queda acentuada na temperatura, por sua vez, coincide com uma notável redução na circulação de clientes, impactando negativamente as vendas.

Nas faixas de temperatura mais amenas (entre 40°F e 70°F), as vendas tendem a apresentar uma melhora consistente. Contudo, ao alcançarmos temperaturas mais extremas, próximas dos 90°F, as vendas da Loja 10 atingem seus níveis mais baixos.

Diante dessa sensibilidade às variações de temperatura, torna-se crucial considerar a implementação de modalidades de atendimento ao cliente aprimoradas. A oferta de entregas personalizadas e eficientes, juntamente com opções de retirada na loja de maneira dinâmica e conveniente, pode mitigar o impacto da menor circulação em temperaturas extremas, proporcionando maior conforto e praticidade aos clientes.

Adicionalmente, a análise das tendências de consumo por faixa de temperatura pode fornecer insights valiosos sobre quais produtos experimentam um aumento na demanda em diferentes condições climáticas. Essa compreensão permitirá à Loja 10 otimizar seu estoque e suas estratégias de marketing, capitalizando as mudanças nos hábitos de consumo influenciados pela temperatura.

Em suma, a temperatura emerge como um fator ambiental com influência direta e considerável sobre o desempenho de vendas da Loja 10. A adaptação das estratégias de atendimento e a análise proativa do comportamento do consumidor em relação às condições climáticas são elementos chave para sustentar e impulsionar as vendas, mesmo em cenários de temperaturas extremas.
